# Features

- Processor Bus Frequency up to 100 MHz
- 64- or 32-bit Data Bus and 32-bit Address Bus
- Provides Support for Either Asynchronous SRAM, Burst SRAM, or Pipelined Burst SRAM
- Compliant with PCI Specification, Revision 2.1
- PCI Interface Operates up to 66 MHz/5.0V Compatible
- IEEE 1149.1 Compliant, JTAG Boundary-scan Interface
- PD Max = 1W (66 MHz), Full Operating Conditions
- Nap, Doze and Sleep Modes for Power Savings
- Two-channel Integrated DMA Controller
- Message Unit
  - Intelligent Input/Output (Two-wire Interface) Message Controller
  - Two Door Bell Registers
  - Inbound and Outbound Messaging Registers
- Inter-integrated Circuit (Two-wire Interface) Controller, Full Master/Slave Support
- Embedded Programmable Interrupt Controller (EPIC)
  - Five Hardware Interrupts (IRQs) or 16 Serial Interrupts
  - Four Programmable Timers

# Description

The PC107A PCI Bridge/Integrated Memory Controller provides a bridge between the Peripheral Component Interconnect, (PCI) bus and PowerPC 603e<sup>™</sup>, PowerPC 740<sup>™</sup>, PowerPC 750<sup>™</sup> or PC7400 microprocessors.

PCI support allows system designers to design systems quickly using peripherals already designed for PCI and other standard interfaces available in the personal computer hardware environment. The PC107A provides many other necessities for embedded applications including a high-performance memory controller and dual processor support, 2-channel flexible DMA controller, an interrupt controller, an I<sub>2</sub>O-ready message unit, an inter-integrated circuit controller (Two-wire Interface), and low skew clock drivers. The PC107A contains an Embedded Programmable Interrupt Controller (EPIC) featuring five hardware interrupts (IRQ's) as well as sixteen serial interrupts along with four timers. The PC107A uses an advanced, 2.5V HiP3 process technology and is fully compatible with TTL devices.

PBGA 503 Flip-chip Plastic Ball Grid Array

GH suffix HITCE 503 Ceramic Ball Grid Array

# Screening

This product is manufactured in full compliance with:

- PBGA upscreenings based upon Atmel standards
- Full military temperature range (Tj = -55°C, +125°C)
- Industrial temperature range (Tj = -40°C, +110°C)
- HiTCE (TBC)

PCI Bridge Memory Controller

# PC107A

# Preliminary Specification β-site

Rev. 2137C-HIREL-03/04

# **General Description**

# Simplified Block Diagram

**Am** The PC107A integrates a PCI bridge, memory controller, DMA controller, EPIC interrupt controller/timers, a message unit with an Intelligent Input/Output ( $I_2O$ ) message controller, and an Inter-integrated Circuit (two-wire interface) controller. The integration reduces the overall packaging requirements and the number of discrete devices required for an embedded system.

Figure 1 shows the major functional units within the PC107A. Note that this is a conceptual block diagram intended to show the basic features rather than an attempt to show how these features are physically implemented.

### Figure 1. PC107A Block Diagram

Two-channel Integrated DMA Controller (Writes to ROM/Port × Not Supported)							
		- Some Internal co	Infiguration registers accessible from PCI				
3		Two-channel Integra	ted DMA Controller (Writes to ROM/Port × Not Supported)				
AIMEL 3							
			JEL 3				

- Supports direct mode or chaining mode (automatic linking of DMA transfers)
- Supports scatter gathering-read or write discontinuous memory
- Interrupt on completed segment, chain, and error
- Local-to-local memory
- PCI-to-PCI memory
- PCI-to-local memory
- PCI memory-to-local memory
- Message Unit
  - Two doorbell registers
  - An extended doorbell register mechanism that facilitates interprocessor communication through interrupts in a dual-local-processor system
  - Two inbound and two outbound messaging registers
  - I<sub>2</sub>O message controller
- Two-wire Interface Controller with Full Master/Slave Support (Except Broadcast All)
- Embedded Programmable Interrupt Controller (EPIC)
  - Five hardware interrupts (IRQs) or 16 serial interrupts
  - Four programmable timers
- Integrated PCI Bus, CPU, and SDRAM Clock Generation
- Programmable PCI Bus, 60x, and Memory Interface Output Drivers
- Dynamic Power Management Supports 60x Nap, Doze, and Sleep Modes
- Programmable Input and Output Signals with Watchpoint Capability
- Built-in PCI Bus Performance Monitor Facility
- Debug Features
  - Error injection/capture on data path
  - IEEE 1149.1 (JTAG)/test interface
- Processor Interface
  - Supports up to two PowerPC<sup>™</sup> microprocessors with 60x bus interface
  - Supports various operating frequencies and bus divider ratios
  - 32-bit address bus, 64/32-bit data bus supported at 100 MHz
  - Supports full memory coherency
  - Supports optional local bus slave
  - Decoupled address and data buses for pipelining of 60x accesses
  - Store gathering on 60x-to-PCI writes
  - Concurrent transactions on 60x and PCI buses supported

# **Pin Assignments**

**Pinout Listings** 

Table 1 provides the pinout listing for the PC107A, 503 PBGA package.

## Table 1. PC107A Pinout Listing

Signal Name	Package Pin Number	Pin Type	Supply Voltage	Output Driver Type	Notes
	60x Processor	Interface Signal	S

MTP[1-2]	B12, B13	I/O	GV <sub>DD</sub>	DRV_MEM_ADDR	(4)(9)

- Notes: 1. This pin has an internal pull-up resistor which is enabled only when the PC107A is in the reset state. The value of the internal pull-up resistor is not guaranteed, but is sufficient to ensure that a logic "1" is read into configuration bits during reset.
  - 2. This pin is a reset configuration pin.
  - 3. MDL[0] is a reset configuration pin and has an internal pull-up resistor which is enabled only when the MPC107 is in the reset state. The value of the internal pull-up resistor is not guaranteed, but is sufficient to insure that a logic '1' is read into configuration bits during reset.
  - 4. Multi-pin signals such as AD[0–31] or DL[0–31] have their physical package pin numbers listed in order corresponding to the signal names. Ex: AD0 is on pin D21, AD1 is on pin D23,... AD31 is on pin N23.
  - SDMA[10–1] are reset configuration pins and have internal pull-up resistors which are enabled only when the MPC107 is in the reset state. The values of the internal pull-up resistors is not guaranteed, but are sufficient to ensure that logic "1"s are read into the configuration bits during reset.
  - 6. Recommend a weak pull-up resistor (2 k $\Omega$  10 k $\Omega$ ) be placed on this PCI control pin to LV<sub>DD</sub>.
  - 7. V<sub>IH</sub> and V<sub>IL</sub> for these signals are the same as the PCI V<sub>IH</sub> and V<sub>IL</sub> entries in Table 7, "DC Electrical Specifications."
  - 8. Recommend a weak pull-up resistor (2 k $\Omega$  10 k $\Omega$ ) be placed on this pin to OV<sub>DD</sub>.
  - 9. Recommend a weak pull-up resistor (2 k $\Omega$  10 k $\Omega$ ) be placed on this pin to GV<sub>DD</sub>.
  - 10. This pin has an internal pull-up resistor; the value of the internal pull-up resistor is not guaranteed, but is sufficient to prevent unused inputs from floating.
  - 11. This pin is affected by programmable PCI\_HOLD\_DEL parameter, see "PCI Signal Output Hold Timing" on page 29."
  - 12. This pin is an open drain signal.
  - 13. This pin is a sustained tri-state pin as defined by the PCI Local Bus Specification.
  - 14. See "Connection Recommendations" on page 43 for additional information on this pin.
  - 15. A weak pull-up resistor is recommend (2 k $\Omega$  10 k $\Omega$ ) to be placed on this pin to BV<sub>DD</sub>.
  - 16. If  $BV_{DD} = 2.5V \pm 5\%$ , this microprocessor interface pin needs to be DC voltage level shifted from  $OV_{DD}$  (3.3 ±0.3V) to 2.5V ±5%; this can typically be accomplished with a two resistor voltage divider circuit since the signal is an output only signal.

### **Signal Description**

# PC107A [Preliminary]

# **Detailed Specification**

Scope	This drawing describes the specific requirements for the PC107A, in compliance with Atmel standard screening.
Applicable	1. MIL-STD-883: Test methods and procedures for electronics.
Documents	2. SQ32S0100.0: Quality levels for supplied components.
Requirements	

General The microcircuits are in accordance with the applicable documents and as specified herein.

## **Design and Construction**

**Terminal Connections** The terminal connections are shown in Table 1, "PC107A Pinout Listing," on page 5.

Absolute Maximum Ratings The tables in this section describe the PC107A DC electrical characteristics. Table 2 provides the absolute maximum ratings.

### Table 2. Absolute Maximum Ratings

Symbol	Characteristic <sup>(1)</sup>	Value	Unit
V <sub>DD</sub>	Supply Voltage – Core	-0.3 to 2.75	V
GV <sub>DD</sub>	Supply Voltage – Memory Bus Drivers	-0.3 to 3.6	V
BV <sub>DD</sub>	Supply Voltage – Processor Bus Drivers	-0.3 to 3.6	V
OV <sub>DD</sub>	Supply Voltage – PCI and Standard I/O Buffers	-0.3 to 3.6	V
AV <sub>DD</sub> /LAV <sub>DD</sub>	Supply Voltage – PLLs and DLL	-0.3 to 2.75	V
LV <sub>DD</sub>	Supply Voltage – PCI Reference	-0.3 to 5.4	V
V <sub>IN</sub>	Input Voltage <sup>(2)</sup>	-0.3 to 3.6	V
TJ	Operational Die-Junction Temperature Range	-55 to 125	°C
T <sub>STG</sub>	Storage Temperature Range	-55 to 150	°C

Notes: 1. Functional and tested operating conditions are given in Table 3. Absolute maximum ratings are stress ratings only and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

2. PCI inputs with  $LV_{DD}$  = 5V ± 5% V DC may be correspondingly stressed at voltages exceeding  $LV_{DD}$  + 0.5V DC.

# RecommendedTable 3 provides the recommended operating conditions for the PC107A.Operating ConditionsImage: Condition of the PC107A and the PC107A and

#### Table 3. Recommended Operating Conditions

Symbol	Characteristic		Recommended Value	Unit	Notes
V <sub>DD</sub>	Supply Voltage	Supply Voltage		V	(4)
GV <sub>DD</sub>	Supply Voltages for Men	nory Bus Drivers	3.3 ±5%	V	(6)
				V	(6)
BV <sub>DD</sub>	Supply Voltages for Proc	cessor Bus Drivers	2.5 ±5%	V	(-)
OV <sub>DD</sub>	I/O Buffer supply for PC	and Standard	3.3 ±0.3	V	(4)
AV <sub>DD</sub>	PLL Supply Voltage	PLL Supply Voltage		V	(5)
LAV <sub>DD</sub>	DLL Supply Voltage	DLL Supply Voltage		V	(5)
1.17			5.0 ±5%	V	(7)(8)
LV <sub>DD</sub>	PCI Reference		3.3 ±0.3	V	(7)(8)
		PCI Inputs	0 to 3.6 or 5.75	V	(1)(2)
V <sub>IN</sub>	Input Voltage	All Other Inputs		V	(3)
TJ	Die-Junction Temperatu	re	-55°C to 125°C	°C	

Notes: 1. PCI pins are designed to withstand  $LV_{DD}$  + 0.5V DC when  $LV_{DD}$  is connected to a 5.0V DC power supply.

2. PCI pins are designed to withstand  $LV_{DD}$  + 0.5V DC when  $LV_{DD}$  is connected to a 3.3V DC power supply.

Cautions:

- 3. Input voltage ( $V_{IN}$ ) must not be greater than the supply voltage ( $V_{DD}/AV_{DD}/LAV_{DD}$ ) by more than 2.5V at all times, including during power-on reset.
- 4. OV<sub>DD</sub> must not exceed V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> by more than 1.8V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- 5. V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> must not exceed OV<sub>DD</sub> by more than 0.6V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- 6. BV<sub>DD</sub>/GV<sub>DD</sub> must not exceed V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> by more than 1.8V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- 7. LV<sub>DD</sub> must not exceed V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> by more than 5.4V at any time including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences
- 8. LV<sub>DD</sub> must not exceed OV<sub>DD</sub> by more than 3.6V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.

Figure 3 shows the supply voltage sequencing and separation cautions.

Notes: 1. Numbers associated with waveform separations correspond to caution numbers listed in Table 3, "Recommended Operating Conditions," on page 12.

- 2. Refer to "Power Supply Voltage Sequencing" on page 42 for additional information.
- 3. Refer to Table 10 on page 25 for additional information on PLL Relock and reset signal assertion timing requirements.
- 4. Refer to Table 11 on page 26 for additional information on reset configuration pin setup timing requirements.
- 5. HRESET must transition from a logic 0 to a logic 1 in less than one SDRAM\_SYNC\_IN clock cycle for the device to be in the non-reset state.
- 6. HRESET\_CPU negates 2<sup>17</sup> memory clock cycles after HRESET negates.

Figure 4 shows the undershoot and overshoot voltage of the memory interface of the PC107A.

Figure 5 and Figure 6 show the undershoot/overshoot voltage of the PCI interface for 3.3 and 5V signals, respectively.

# PC107A [Preliminary]

#### Figure 6. Maximum AC Waveforms for 3.3V Signaling

## **Thermal Information**

#### **Package Characteristics**

Table 4 provides the package thermal characteristics for the PC107A.

Symbol	Characteristic <sup>(1)</sup>	Value	Unit
$R\theta_{JA}$	Junction-to-ambient natural convection <sup>(1)(2)</sup> (Single-layer board-1s)	30	°C/W
Rθ <sub>JMA</sub>	Junction-to-ambient natural convection <sup>(1)(3)</sup> (Four-layer board-2s2p)	26	°C/W
Rθ <sub>JMA</sub>	Junction-to-ambient (at 200 ft/min) <sup>(1)(3)</sup> (Single-layer board-1s)	25	°C/W
$R\theta_{JMA}$	Junction-to-ambient (at 200 ft/min) <sup>(1)(3)</sup> (Four-layer board-2s2p)	22	°C/W
$R\theta_{JB}$	Junction-to-board <sup>(4)</sup>	20	°C/W
$R\theta_{JC}$	Junction-to-case <sup>(5)</sup>	< 0.1	°C/W

Notes: 1. Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.

- 2. Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.
- 3. Per JEDEC JESD51-6 with the board horizontal.
- Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- 5. Thermal resistance between the die and the case top surface without thermal grease.

#### Package Thermal Characteristics for HiTCE

Table 5 provides the package thermal characteristics for the PC107 HiTCE.

### Table 5. Package Thermal Characteristics for HiTCE Package<sup>(1)</sup>

	Value	
Characteristic	PC107 HITCE	Unit
Thermal resistance junction to case <sup>(2)</sup>	0.295	°C/Watt
Thermal resistance junction to bottom of balls	15.8	°C/Watt
Thermal resistance junction to board, Jedec JESD51-8 (2s2p board)	18.4	°C/Watt
Thermal resistance junction to ambient, Jedec JESD51-2 (2s2p board = 2 signals + 2 power planes in board)	26.3	°C/Watt

Notes: 1. Nominal values: means computed with nominal geometry and nominal thermal conductivities of materials as given in legend of each simulation results.

2. In this case thermal resistance junction to case is thermal resistance junction to top of Silicon die, and value almost not depend from substrate used for land grid array. Value depends strongly on heating zone size in Silicon chip assumption. In present simulations heating zone is 5.8 mm × 3.65 mm that is 42% of die size. Assuming the full die size as uniformly power dissipating is not realistic.

Assuming 8.3 mm × 5.15 mm heating zone (85% of die surface) leads to 0.15°C/watt instead of 0.29°C/watt.

#### Thermal Management Information

An estimation of the chip junction temperature, T<sub>J</sub>, can be obtained from the equation:

$$\Gamma_{\rm J} = T_{\rm A} + (R_{\rm HJA} \times P_{\rm D})$$

where

 $T_A$  = ambient temperature for the package (°C)

 $R_{\theta JA}$  = junction-to-ambient thermal resistance (°C/W)

 $P_D$  = power dissipation in the package (W)

The junction-to-ambient thermal resistance is an industry-standard value that provides a quick and easy estimation of thermal performance. Table 4 has four junction-to-ambient thermal resistances ( $R_{\theta JA}$  or  $R_{\theta JMA}$ ). Two test boards are used: single-signal-layer (1s) and four-layer boards with two internal planes (2s2p). Which value is closer to the application depends on the system board thermal resistance and the density of other high-power dissipation components.

To illustrate the process, determine the junction temperature based on the values provided in Table 4 for an PC107 that is mounted on a board with many internal planes using arbitrary values. If the PC107 is doing most of the power dissipation, use  $R_{\theta,JMA}$  of 26°C/W given in Table 4. The ambient temperature near the device is 45°C. Suppose the total typical power dissipation at 100 MHz core frequency is 2.1W (see Table 6). The junction temperature is:

 $T_J = 45 + (2.1 \times 26) = 100^{\circ}C.$ 

If this value is less than the maximum junction temperature noted in Table 2, the PC107 will not need a heat sink. If the ambient temperature is higher or the power dissipation is higher because of faster bus speed, the device will probably need a heat sink.

The PC107 may need a heat sink depending on the system. This section provides thermal management information for the flip chip plastic ball grid array (FC-PBGA) package for air-cooled applications. Proper thermal control design is primarily dependent on the system-level design—the heat sink, airflow, and thermal interface material. To reduce the die-junction temperature, heat sinks may be attached to the package by several methods—spring clip to holes in the printed-circuit board or package, and mounting clip and screw assembly (see Figure 7); however, due to the potential large mass of the heat sink, attachment through the printed-circuit board is suggested. The force of the heat sink on the die should not exceed 6 lb.

The heat sink surface must be flat without protrusions and must be parallel with the die as the heat sink is brought into contact to avoid chipping the edges of the die and the heat sink. Because of the small contact area of the heat sink, it is suggested that the mounting force be centered over the die.

Figure 7. Package Exploded Cross-Sectional View with Several Heat Sink Options

The board designer can choose between several types of heat sinks to place on the PC107. There are several commercially available heat sinks for the PC107 provided by the listvendors:

Aavid Thermalloy 80 Commercial St. Concord, NH 03301 Internet: www.aavidthermalloy.com	603-224-9988
Alpha Novatech 473 Sapena Ct. #15 Santa Clara, CA 95054 Internet: www.alphanovatech.com	408-749-7601
International Electronic Research Corporation (IERC) 413 North Moss St. Burbank, CA 91502 Internet: www.ctscorp.com	818-842-7277
Tyco Electronics Chip Coolers™ P.O. Box 3668 Harrisburg, PA 17105-3668 Internet: www.chipcoolers.com	800-522-6752
Wakefield Engineering 33 Bridge St. Pelham, NH 03076 Internet: www.wakefield.com	603-635-5102

Ultimately, the final selection of an appropriate heat sink depends on many factors, such as thermal performance at a given air velocity, spatial volume, mass, attachment method, assembly, and cost.

# Internal Package Conduction Resistance

For the PBGA packaging technology, the intrinsic conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance,
- The die junction-to-ball thermal resistance.

Figure 8 depicts the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.

Figure 8. C4 Package with Heat Sink Mounted to a Printed-Circuit Board

Note: The internal versus external package resistance

For this PBGA package, heat is dissipated from the component via several concurrent paths. Heat is conducted through the silicon and may be removed to the ambient air by convection and/or radiation. In addition, a second, parallel heat flow path exists by conduction in parallel through the C4 bumps and the epoxy under-fill, to the plastic substrate for further convection cooling off the edges. Then from the plastic substrate, heat is conducted via the leads/balls to the next-level interconnect (printed-circuit board) whereupon the primary mode of heat transfer is by convection and/or radiation.

# <u>AIMEL</u>

# **Power Characteristics**

Table 6 provides the preliminary power consumption estimates for the PC107A. Power consumption on the PLL supply pin (AV<sub>DD</sub>) and the DLL supply pin (LAV<sub>DD</sub>) < 15 mW. This information is based on characterization data.

Table 6.	Power Consumption
----------	-------------------

	PCI_SYNC_IN/Core Frequency (MHz)									
	25	25/50		33/33		33/66		66/100		
Mode	V <sub>DD</sub> Power	I/O Power	V <sub>DD</sub> Power	I/O Power	V <sub>DD</sub> Power	I/O Power	V <sub>DD</sub> Power	I/O Power	Unit	Notes
Typical	468	923	351	759	644	1087	933	1122	mW	(1)(2)
Doze	176	697	118	636	235	800	350	915	mW	(1)(2)
Nap	139	744	93	693	185	420	276	970	mW	(1)(2)
Sleep	79	718	45	677	102	841	138	939	mW	(1)(2)

Notes: 1. Power is measured with  $V_{DD} = 2.625V$ ,  $GV_{DD} = OV_{DD} = BV_{DD} = 3.45V$  at 0°C and one DIMM populated in test system. 2. All clock drivers enabled.

# PC107A [Preliminary]

# Electrical Characteristics

This section provides the AC and DC electrical specifications and thermal characteristics for the PC107A.

# **Static Characteristics**

**DC Electrical Specification** 

Table 7 provides the DC electrical characteristics for the PC107A. At recommended operating conditions (see Table 3 on page 12)

			Valu			
Characteristics	Conditions <sup>(1)</sup>	Symbol	Min Max		Unit	
Input High Voltage <sup>(2)(3)</sup>	PCI only	V <sub>IH</sub>	0.65*OV <sub>DD</sub> <sup>(3)</sup>	LV <sub>DD</sub>	V	
Input Low Voltage	PCI only	V <sub>IL</sub>	_	0.3*OV <sub>DD</sub>	V	
Input High Voltage <sup>(2)</sup>	All other pins ( $GV_{DD} = 3.3V$ )	V <sub>IH</sub>	2.0	_	V	
Input High Voltage <sup>(2)</sup>	All other pins ( $BV_{DD} = 2.5V$ )	V <sub>IH</sub>	1.7	_	V	
Input Low Voltage	All inputs except PCI_SYNC_IN	V <sub>IL</sub>	GND	0.8	V	
PCI_SYNC_IN Input High Voltage		CVIH	2.4	_	V	
PCI_SYNC_IN Input Low Voltage		CVIL	GND	0.4	V	
Input Leakage Current for pins using DRV_PCI driver <sup>(4)</sup>	$0.5V \le V_{IN} \le 2.7V$ at LV <sub>DD</sub> = 4.75	IL.	-	± 70	μA	
Input Leakage Current all others <sup>(4)</sup>	$LV_{DD} = 3.6V (GV_{DD} \le 3.465)$	Ι <sub>L</sub>	_	± 10	μA	
Output High Voltage <sup>(5)</sup>	$I_{OH}$ = Driver Dependent <sup>(5)</sup> (GV <sub>DD</sub> = 3.3V)	V <sub>OH</sub>	2.4	_	V	
Output Low Voltage <sup>(5)</sup>	$I_{OL}$ = Driver Dependent <sup>(5)</sup> (GV <sub>DD</sub> = 3.3V)	V <sub>OL</sub>	_	0.4	V	
Output Line Matter (5)	$I_{OH}$ = Driver Dependent <sup>(5)</sup> (BV <sub>DD</sub> = 2.5V) All outputs except CPU_CLKS[0-2]	V <sub>OH</sub>	1.85	_	V	
Output High Voltage <sup>(5)</sup>	$I_{OH}$ = Driver Dependent <sup>(5)</sup> (BV <sub>DD</sub> = 2.5V) CPUCLKS[0-2] Only	V <sub>OH</sub>	2.0	_	V	
Output Low Voltage <sup>(5)</sup>	$I_{OL}$ = Driver Dependent <sup>(5)</sup> (BV <sub>DD</sub> = 2.5V) All outputs except CPU_CLK[0-2]	V <sub>OL</sub>	-	0.4	V	
	$I_{OL}$ = Driver Dependent <sup>(5)</sup> (BV <sub>DD</sub> = 2.5V) CPU_CLK[0-2] Only	V <sub>OL</sub>	-	0.3	V	
Capacitance <sup>(6)</sup>	$V_{IN} = 0V, f = 1 MHz$	C <sub>IN</sub>	-	7.0		

### Table 7. DC Electrical Specifications

Notes: 1. These specifications are for the default driver strengths indicated in Table 8 on page 22.

2. See Figure 23 on page 35 for pins with internal pull-up resistors.

3. The minimum Input high voltage is not compliant with the *PCI Local Bus Specification* (Rev 2.1) which specifies 0.5\*OV<sub>DD</sub> for minimum input high voltage.

4. Leakage current is measured on input pins and on output pins in the high impedance state. The leakage current is measured for nominal  $OV_{DD}/LV_{DD}$  and  $V_{DD}$  or both  $Ov_{DD}/LV_{DD}$  and  $V_{DD}$  must vary in the same direction.

5. See Table 8 on page 22 for the typical drive capability of a specific signal pin based upon the type of output driver associated with that pin as listed in Table 1 on page 5.

6. Capacitance is periodically sampled rather than 100% tested.

# Output Driver Characteristics

Table 8 provides information on the characteristics of the output drivers referenced in Table 1 on page 5. The values are from the PC107A IBIS model (v1.1) and are not tested, for additional detailed information see the complete IBIS model listing at http://www.motorola.com/semiconductor.

#### Table 8. Drive Capability of PC107A Output Pins

Driver Type	Programmable Output Impedance (Ohms)	Supply Voltage	I <sub>он</sub>	I <sub>OL</sub>	Unit	Notes
	20	$BV_{DD} = 3.3V$	36.6	18.1	mA	(2)(5)
		$BV_{DD} = 2.5V$	21.4	15.6	mA	(3)(6)(7)
DRV_CPU	40 (default)	$BV_{DD} = 3.3V$	18.6	9.2	mA	(2)(5)
		$BV_{DD} = 2.5V$	10.8	7.9	mA	(3)(6)(7)
DRV_PCI	25	$OV_{DD} = 3.3V$	12.0	12.4	mA	(1)(4)
	50 (default)	$OV_{DD} = 3.3V$	6.1	6.3	mA	(1)(4)
	8 (default)	$GV_{DD} = 3.3V$	89.0	42.3	mA	(2)(5)
DRV_MEM_ADDR	13.3	$GV_{DD} = 3.3V$	55.8	26.4	mA	(2)(5)
DRV_PCI_CLK	20	$GV_{DD} = 3.3V$	36.6	18.1	mA	(2)(5)
	40	$GV_{DD} = 3.3V$	18.6	9.2	mA	(2)(5)
	20 (default)	$GV_{DD} = 3.3V$	36.6	18.1	mA	(2)(5)
DRV_MEM_DATA	40	$GV_{DD} = 3.3V$	18.6	9.2	mA	(2)(5)

Notes: 1. For DRV\_PCI, I<sub>OH</sub> read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.33V label by interpolating between the 0.3V and 0.4V table entries' current values which corresponds to the PCI V<sub>OH</sub> = 2.97 = 0.9\*OV<sub>DD</sub> (OV<sub>DD</sub> = 3.3V) where Table Entry Voltage = OV<sub>DD</sub> - PCI V<sub>OH</sub>.

2. For all others with  $GV_{DD}$  or  $BV_{DD} = 3.3V$ ,  $I_{OH}$  read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.9V table entry which corresponds to the  $V_{OH} = 2.4V$  where Table Entry Voltage =  $G/BV_{DD} - V_{OH}$ .

For all others with BV<sub>DD</sub> = 2.5V, I<sub>OH</sub> read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.65V table entry by interpolating between the 0.6V and 0.7V table entries' current values which corresponds to the V<sub>OH</sub> = 1.85V where Table Entry Voltage = BV<sub>DD</sub> - V<sub>OH</sub>.

4. For DRV\_PCI,  $I_{OL}$  read from the IBIS listing in the pull-down mode, I(Min) column, at 0.33V = PCI V<sub>OL</sub> = 0.1\*OV<sub>DD</sub> (OV<sub>DD</sub> = 3.3V) by interpolating between the 0.3V and 0.4V table entries.

 For all others with GV<sub>DD</sub> or BV<sub>DD</sub> = 3.3V, I<sub>OL</sub> read from the IBIS listing in the pull-down mode, I(Min) column, at the 0.4V table entry.

6. For all others with BV<sub>DD</sub> = 2.5V, I<sub>OL</sub> read from the IBIS listing in the pull-down mode, I(Min) column, at the 0.4V table entry.

7. For  $BV_{DD} = 2.5V$ , the  $I_{OH}$  and  $I_{OL}$  values are estimated from the io\_mem\_data\_XX\_2.5 and io\_mem\_addr\_XX\_2.5 sections of the IBIS model where XX = driver output impedance (20 or 40 $\Omega$ ).

# Dynamic Electrical Characteristics

**Clock AC Specifications** 

Table 9 provides the clock AC timing specifications as defined in Section.

At recommended operating conditions (see Table 3 on page 12) with GV\_{DD} = 3.3V  $\pm$  5% and LV\_{DD} = 3.3  $\pm$ 0.3V

Num	Characteristics and Conditions <sup>(1)</sup>	Min	Max	Unit	Notes
1a	Frequency of Operation (PCI_SYNC_IN)	12.5	66	MHz	(8)
1b	PCI_SYNC_IN Cycle Time	80	15	ns	(8)
2, 3	PCI_SYNC_IN Rise and Fall Times	_	2.0	ns	(2)
4	PCI_SYNC_IN Duty Cycle Measured at 1.4V	40	60	%	
5a	PCI_SYNC_IN Pulse Width High Measured at 1.4V	6	9	ns	(3)
5b	PCI_SYNC_IN Pulse Width Low Measured at 1.4V	6	9	ns	(3)
7	PCI_SYNC_IN Jitter	-	< 150	ps	
9a	PCI_CLK[0-4] Skew (Pin to Pin)	-	500	ps	
9b	SDRAM_CLK[0-3] Skew (Pin to Pin)	_	350	ps	
9c	CPU_CLK[0–2] Skew (Pin to Pin)	-	350	ps	
9d	SDRAM_CLK[0-3]/CPU_CLK[0-2] Jitter	-	150	ps	
10	Internal PLL Relock Time	_	100	μs	(3)(4)(6)
15	DLL lock range with DLL_STANDARD = 1 (default)	See Figure 1	1 on page 24	ns	(7)
16	DLL lock range with DLL_STANDARD = 0	See Figure 1	2 on page 25	ns	(7)
17	Frequency of Operation (OSC_IN)	12.5	66	MHz	(8)
18	OSC_IN Cycle Time	80	15	ns	(8)
19	OSC_IN Rise and Fall Times	_	5	ns	(5)
20	OSC_IN Duty Cycle Measured at 1.4V	40	60	%	
21	OSC_IN Frequency Stability	-	100	ppm	

#### Table 9. Clock AC Timing Specifications

Notes: 1. These specifications are for the default driver strengths indicated in Table 8 on page 22.

- 2. Rise and fall times for the PCI\_SYNC\_IN input are measured from 0.4V to 2.4V.
- 3. Specification value at maximum frequency of operation.
- 4. Relock time is guaranteed by design and characterization. Relock time is not tested.
- 5. Rise and fall times for the OSC\_IN input is guaranteed by design and characterization. OSC\_IN input rise and fall times are not tested.
- 6. Relock timing is guaranteed by design. PLL-relock time is the maximum amount of time required for PLL lock after a stable V<sub>DD</sub> and PCI\_SYNC\_IN are reached during the reset sequence. This specification also applies when the PLL has been disabled and subsequently re-enabled during sleep mode. Also note that HRESET must be held asserted for a minimum of 255 bus clocks after the PLL-relock time during the reset sequence.
- DLL\_STANDARD is bit 7 of the PMC2 register <72>. N is a non-zero integer (1 or 2). T<sub>clk</sub> is the period of one SDRAM\_SYNC\_OUT clock cycle in ns. t<sub>loop</sub> is the propagation delay of the DLL synchronization feedback loop (PC board runner) from SDRAM\_SYNC\_OUT to SDRAM\_SYNC\_IN in ns; 6.25 inches of loop length (unloaded PC board runner) corresponds to approximately 1 ns of delay. See Figure 12 on page 25 for DLL locking ranges.
- 8. See Table 19 on page 41 for PCI\_SYNC\_IN input frequency range for specific PLL\_CFG[0-3] settings.

Figure 9 shows the PCI\_SYNC\_IN Input Clock Timing Diagram, Figure 10 illustrates how Table 9 clock specifications relate to the PC107A Clocking diagram, and Figure shows the DLL Locking Range Loop Delay vs. Frequency of Operation.

Figure 9. PCI\_SYNC-IN Input Clock Timing Diagram

VM = Midpoint Voltage (1.4V)

### Figure 10. Clock Subsystem Block Diagram

Note: Specification numbers are from Table 9.

Figure 11. DLL Locking Range Loop Delay (DLL\_Standard = 0)

#### **Operating Frequency**

This section provides the AC electrical characteristics for the PC107A. After fabrication, functional parts are sorted by maximum core frequency as shown in Figure 10 and "Clock AC Specifications" on page 23 and tested for conformance to the AC specifications for that frequency. The core frequency is determined by the bus (PCI\_SYNC\_IN) clock frequency and the settings of the PLL\_CFG[0–3] signals. Parts are sold by maximum processor core frequency; see "Ordering Information" on page 46.

Table 10 provides the operating frequency information for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with  $LV_{DD} = 3.3 \pm 0.3V$ .

Table 10.	Operating	Frequency
-----------	-----------	-----------

	66 I	MHz	100 MHz		
Characteristic <sup>(1)</sup>	Min	Max	Min	Max	Unit
Core (memory bus/processor bus) frequency	25	66	25	100	MHz
PCI input frequency (PCI_SYNC_IN)	12.5 – 66		MHz		

Note: 1. Caution: The PCI\_SYNC\_IN frequency and PLL\_CFG[0-3] settings must be chosen such that the resulting peripheral logic/memory bus frequency, CPU (core) frequency, and PLL (VCO) frequencies do not exceed their respective maximum or minimum operating frequencies. Refer to the PLL\_CFG[0-3] signal description in "Clock Relationships Choice" on page 41 for valid PLL\_CFG[0-3] settings and PCI\_SYNC\_IN frequencies.

# AMEL

# Input AC Timing Specifications

Table 11 provides the input AC timing specifications. See Figure 13 on page 27 and Figure 14 on page 27.

At recommended operating conditions (see Table 3 on page 12) with GV\_{DD} = 3.3V \pm 5\% and LV\_DD = 3.3  $\pm 0.3V$ 

#### Table 11. Input AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
10a	PCI Input Signals Valid to PCI_SYNC_IN (Input Setup)	3.0	_	ns	(2)(3)
10b	Memory Interface Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	_	ns	(1)(3)
10c	Epic, Misc. Debug Input Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	-	ns	(1)(3)
10d	Two-wire interface Input Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	-	ns	(1)(3)
10e	Mode select Inputs Valid to HRESET (Input Setup)	9*t <sub>CLK</sub>	-	ns	(1)(3)(5)
10f	60x Processor Interface Signals Valid to SDRAM_SYNC_IN (Input Setup)	2.0	-	ns	(1)(3)
11a1	PCI_SYNC_IN (SDRAM_SYNC_IN) to Inputs Invalid (Input Hold)	1.0	-	ns	(2)(3)
11a2	Memory Interface Signals SDRAM_SYNC_IN to Inputs Invalid (Input Hold)	0.5	-	ns	(1)(3)
11a3	60x Processor Interface Signals SDRAM_SYNC_IN to Inputs Invalid (Input Hold)	0	-	ns	(1)(3)
11b	HRESET to Mode select Inputs Invalid (Input Hold)	0	-	ns	(1)(3)(5)

Notes: 1. All memory, processor and related interface input signal specifications are measured from the TTL level (0.8 or 2.0V) of the signal in question to the V<sub>M</sub> = 1.4V of the rising edge of the memory bus clock, SDRAM\_SYNC\_IN. SDRAM\_SYNC\_IN is the same as PCI\_SYNC\_IN in 1:1 mode, but is twice the frequency in 2:1 mode (processor/memory bus clock rising edges occur on every rising and falling edge of PCI\_SYNC\_IN). See Figure 13.

2. All PCI signals are measured from OV<sub>DD</sub>/2 of the rising edge of PCI\_SYNC\_IN to 0.4\*OV<sub>DD</sub> of the signal in question for 3.3 V PCI signaling levels. See Figure 14.

3. Input timings are measured at the pin.

4. t<sub>CLK</sub> is the time of one SDRAM\_SYNC\_IN clock cycle.

5. All mode select input signals specifications are measured from the TTL level (0.8 or 2.0V) of the signal in question to the  $V_{\rm M} = 1.4$ V of the rising edge of the HRESET signal. See Figure 15 on page 27.

# PC107A [Preliminary]

VM = Midpoint Voltage (1.4V)

### Output AC Timing Specification

Table 12 provides the processor bus AC timing specifications for the PC107A. See Figure 13 on page 27 and Figure 14 on page 27.

At recommended operating conditions (see Table 3 on page 12) with  $LV_{DD}$  = 3.3 ±0.3V

Table 12. Output AC Timing Specifications

Num	Characteristics <sup>(3)(6)</sup>	Min	Max	Unit	Notes
12a	PCI_SYNC_IN to Output Valid, 66 MHz PCI, with SDMA4 pulled- down to logic 0 state. See Figure 17.	_	6.0	ns	(2)(4)
128	PCI_SYNC_IN to Output Valid, 33 MHz PCI, with SDMA4 in the default logic 1 state. See Figure 17.	_	11.0	ns	(2)(4)
12b	Memory Interface Signals, SDRAM_SYNC_IN to Output Valid	_	5.5	ns	(1)
12b1	Memory Interface Signal: CKE (100 MHz Device), SDRAM_SYNC_IN to Output Valid	_	5.5	ns	(1)
12b2	Memory Interface Signal: CKE (66 MHz Device), SDRAM_SYNC_IN to Output Valid	_	6.0	ns	(1)
12c	Epic, Misc. Debug Signals, SDRAM_SYNC_IN to Output Valid	_	9.0	ns	(1)
12d	Two-wire interface, SDRAM_SYNC_IN to Output Valid	_	5.0	ns	(1)
12e	60x Processor Interface Signals, SDRAM_SYNC_IN to Output Valid	_	5.5	ns	(1)
10-	Output Hold, 66 MHz PCI, with SDMA4 and SDMA3 pulled-down to logic 0 states. See Table 13.	1.0	-	ns	(2)(4)(5)
13a	13a Output Hold, 33 MHz PCI, with SDMA4 in the default logic 1 state and SDMA3 pulled-down to logic 0 state. See Table 13.		_	ns	(2)(4)(5)
13b	Output Hold (For All Others)	1		ns	(1)
14a	PCI_SYNC_IN to Output High Impedance (T <sub>off</sub> for PCI)	_	14.0	ns	(2)(4)
14b	SDRAM_SYNC_IN to Output High Impedance (For All Others)	_	4.0	ns	(1)

Notes: 1. All memory and related interface output signal specifications are specified from the V<sub>M</sub> = 1.4V of the rising edge of the memory bus clock, SDRAM\_SYNC\_IN to the TTL level (0.8 or 2.0V) of the signal in question. SDRAM\_SYNC\_IN is the same as PCI\_SYNC\_IN in 1:1 mode, but is twice the frequency in 2:1 mode (processor/memory bus clock rising edges occur on every rising and falling edge of PCI\_SYNC\_IN). See Figure 13 on page 27.

- All PCI signals are measured from OV<sub>DD</sub>/2 of the rising edge of PCI\_SYNC\_IN to 0.285\*OV<sub>DD</sub> or 0.615\*OV<sub>DD</sub> of the signal in question for 3.3V PCI signaling levels. See Figure 14 on page 27.
- 3. All output timings assume a purely resistive  $50\Omega$  load (See Figure 16 on page 28). Output timings are measured at the pin; time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
- 4. PCI Bussed signals are composed of the following signals: LOCK, IRDY, C/BE[0–3], PAR, TRDY, FRAME, STOP, DEVSEL, PERR, SERR, AD[0–31], REQ[4–0], GNT[4–0], IDSEL, INTA.

5. PCI hold times can be varied, see "PCI Signal Output Hold Timing" on page 29 for information on programmable PCI output hold times. The values shown for item 13a are for PCI compliance.

6. These specifications are for the default driver strengths indicated in Table 8 on page 22.

### PCI Signal Output Hold Timing

In order to meet minimum output hold specifications relative to PCI\_SYNC\_IN for both 33 MHz and 66 MHz PCI systems, the PC107A has a programmable output hold delay for PCI signals. The initial value of the output hold delay is determined by the values on the SDMA4 and SDMA3 reset configuration signals. Further output hold delay values are available by programming the PCI\_HOLD\_DEL value of the PMCR2 configuration register.

Table 13 describes the bit values for the PCI\_HOLD\_DEL values in PMCR2.

Table 13.	Power	Management	Configuration	Register 2	-0x72

Bit	Name	Reset value	Description
6 – 4	PCI_HOLD_DEL	xx0	PCI output hold delay values relative to PCI_SYNC_IN. The initial values of bits 6 and 5 are determined by the reset configuration pins SDMA4 and SDMA3, respectively. As these two pins have internal pull-up resistors, the default value after reset is 0b110.
			While the minimum hold times are guaranteed at shown values, changes in the actual hold time can be made by incrementing or decrementing the value in these bit fields of this register via software or hardware configuration. The increment is in approximately 400 picosecond steps. Lowering the value in the three bit field decreases the amount of output hold available.
			000 66 MHz PCI. Pull-down SDMA4 configuration pin with a 2 k $\Omega$ or less value resistor. This setting guarantees the minimum output hold, item 13a, and the maximum output valid, item 12a, times as specified in Figure 14 are met for a 66 MHz PCI system. See Figure 17 on page 30.
			010
			011
			100 33 MHz PCI. This setting guarantees the minimum output hold, item 13a, and the maximum output valid, item 12a, times as specified in Figure 14 are met for a 33 MHz PCI system. See Figure 17 on page 30.

# Two-wire Interface AC Timing<br/>SpecificationsTable 14 provides the two-wire interface input AC timing specifications for the PC107A.At recommended operating conditions (see Table 3 on page 12) with $LV_{DD} = 3.3 \pm 0.3V$

Table 14. ⊤	wo-wire Inte	erface Input	AC Timing	Specifications
-------------	--------------	--------------	-----------	----------------

Num	Characteristics	Min	Max	Unit	Notes
1	Start condition hold time	4.0	_	CLKs	(1)(2)
2	Clock low period (The time before the PC107A will drive SCL low as a transmitting slave after detecting SCL low as driven by an external master)	8.0 + (16 × 2 <sup>FDR[4:2]</sup> ) × (5 - 4({FDR[5],FDR[1]} == b'10) - 3({FDR[5],FDR[1]} == b'11) - 2({FDR[5],FDR[1]} == b'00) - 1({FDR[5],FDR[1]} == b'01))	_	CLKs	(1)(2)(4)(5)
3	SCL/SDA rise time (from 0.5V to 2.4V)	_	1	ms	
4	Data hold time	0	-	ns	(2)
5	SCL/SDA fall time (from 2.4V to 0.5V)	_	1	mS	
6	Clock high period (Time needed to either receive a data bit or generate a START or STOP)	5.0	_	CLKs	(1)(2)(5)
7	Data setup time	3.0	_	ns	(3)
8	Start condition setup time (for repeated start condition only)	4.0	_	CLKs	(1)(2)
9	Stop condition setup time	4.0	-	CLKs	(1)(2)

Notes: 1. Units for these specifications are in SDRAM\_CLK/CPU\_CLK units.

2. The actual values depend on the setting of the Digital Filter Frequency Sampling Rate (DFFSR) bits in the Frequency Divider Register two-wire interface FDR. Therefore, the noted timings in the above table are all relative to qualified signals. The qualified SCL and SDA are delayed signals from what is seen in real time on the two-wire interface bus. The qualified SCL, SDA signals are delayed by the SDRAM\_CLK/CPU\_CLK clock times DFFSR times 2 plus 1 SDRAM\_CLK/CPU\_CLK clock. The resulting delay value is added to the value in the table (where this note is referenced). See Figure 19 on page 34.

3. Timing is relative to the Sampling Clock (not SCL).

4. FDR[x] refers to the Frequency Divider Register I2CFDR bit x.

5. Input clock low and high periods in combination with the FDR value in the Frequency Divider Register (I2CFDR) determine the maximum two-wire interface input frequency. See Figure 19 on page 34.

Table 15 provides the two-wire interface Frequency Divider Register (I2CFDR) information for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with  $\text{LV}_{\text{DD}}$  = 3.3V  $\pm$  5%

Table 15.         PC8240 Maximum Two-wire Interface Input Freque	ncy
--	-----

		Max Two-wire Interface Input Frequency <sup>(1)</sup>				
FDR Hex <sup>(2)</sup>	Divider (Dec) <sup>(2)</sup>	SDRAM_CLK/ CPU_CLK at 25 MHz	SDRAM_CLK/ CPU_CLK at 33 MHz	SDRAM_CLK/ CPU_CLK at 50 MHz	SDRAM_CLK/ CPU_CLK at 100 MHz

16, 17, 3A, 3B, 3C, 3D	12288, 14336, 15360, 16384, 20480, 24576	12	16	24	48	
18, 19	18432, 20480	8	10	16	32	
1A, 1B, 3E, 3F	24576, 28672, 30720, 32768	6	8	12	24	
1C, 1D	36864, 40960	4	5	8	16	
1E, 1F	49152, 61440	3	4	6	12	

Notes: 1. Values are in kHz unless otherwise specified.

2. FDR Hex and Divider (Dec) values are listed in corresponding order.

3. Multiple Divider (Dec) values will generate the same input frequency but each Divider (Dec) value will generate a unique output frequency as shown in Table 16 on page 33. Table 16 provides the two-wire interface output AC timing specifications for the PC107A.

At recommended operating conditions (see Table 3 on page 12) with GV\_{DD} = 3.3V  $\pm$  5% and LV\_{DD} = 3.3  $\pm$  0.3V

**Table 16.** Two-wire Interface Output AC Timing Specifications

Num	Characteristics	Min	Max	Unit	Notes
1	Start condition hold time	$(FDR[5] == 0) \times (D_{FDR}/16) / 2N +$ $(FDR[5] == 1) \times (D_{FDR}/16) / 2M$		CLKs	(1)(2)(5)
2	Clock low period	D <sub>FDR</sub> / 2	_	CLKs	(1)(2)(5)
3	SCL/SDA rise time (from 0.5V to 2.4V)	_	_	mS	(3)
4	Data hold time	8.0 + (16 × 2 <sup>FDR[4:2]</sup> ) × (5 - 4({FDR[5],FDR[1]} == b'10) - 3({FDR[5],FDR[1]} == b'11) - 2({FDR[5],FDR[1]} == b'00) - 1({FDR[5],FDR[1]} == b'01))	_	CLKs	(1)(2)(5)
5	SCL/SDA fall time (from 2.4V to 0.5V)	_	< 5	ns	(4)
6	Clock high time	D <sub>FDR</sub> / 2	_	CLKs	(1)(2)(5)
7	Data setup time (PC107A as a master only)	(D <sub>FDR</sub> / 2) - (Output data hold time)	_	CLKs	(1)(5)
8	Start condition setup time (for repeated start condition only)	D <sub>FDR</sub> + (Output start condition hold time)	_	CLKs	(1)(2)(5)
9	Stop condition setup time	4.0	_	CLKs	(1)(2)

Notes: 1. Units for these specifications are in SDRAM\_CLK/CPU\_CLK units.

2. The actual values depend on the setting of the Digital Filter Frequency Sampling Rate (DFFSR) bits in the Frequency Divider Register I2CFDR. Therefore, the noted timings in the above table are all relative to qualified signals. The qualified SCL and SDA are delayed signals from what is seen in real time on the two-wire interface bus. The qualified SCL, SDA signals are delayed by the SDRAM\_CLK/CPU\_CLK clock times DFFSR times 2 plus 1 SDRAM\_CLK/CPU\_CLK clock. The resulting delay value is added to the value in the table (where this note is referenced). See Figure 19 on page 34.

3. Since SCL and SDA are open-drain type outputs, which the PC107A can only drive low, the time required for SCL or SDA to reach a high level depends on external signal capacitance and pull-up resistor values.

4. Specified at a nominal 50 pF load.

5. D<sub>FDR</sub> is the decimal divider number indexed by FDR[5:0] value. Refer to the two-wire Interface chapter's Serial Bit Clock Frequency Divider Selections table. FDR[x] refers to the Frequency Divider Register I2CFDR bit x. N is equal to a variable number that would make the result of the divide (Data Hold Time value) equal to a number less than 16. M is equal to a variable number that would make the result of the divide (Data Hold Time value) equal to a number less than 16. M is equal to a variable number that would make the result of the divide (Data Hold Time value) equal to a number less than 9.

Figure 19. Two-wire Interface Timing Diagram II

Note: DFFSR Filter Clock is the SDRAM\_CLK clock times DFFSR value.

Figure 21. Two-wire Interface Timing Diagram IV (Qualified Signal)

Note: The delay is the Local Memory clock times DFFSR times 2 plus 1 Local Memory clock.

# EPIC Serial Interrupt Mode ACTable 17 provides the EPIC serial interrupt mode AC timing specifications for theTiming SpecificationsPC107A.

At recommended operating conditions (see Table 3 on page 12) with  $LV_{DD}$  = 3.3 ±0.3V

 Table 17. EPIC Serial Interrupt Mode AC Timing Specifications

Num	Characteristics	Min	Мах		Notes
1	S_CLK Frequency	1/14 SDRAM_SYNC_IN	1/2 SDRAM_SYNC_IN	MHz	(1)
2	S_CLK Duty Cycle	40	60	%	
3	S_CLK Output Valid Time	-	6	nS	
4	Output Hold Time	0	_	nS	
5	S_FRAME, S_RST Output Valid Time	_	1 sys_logic_clk period + 6	nS	(2)
6	S_INT Input Setup Time to S_CLK	1 sys_logic_clk period + 2	_	nS	(2)
7	S_INT Inputs Invalid (Hold Time) to S_CLK	_	0	nS	(2)

Notes: 1. See the PC107A User's Manual for a description of the EPIC Interrupt Control Register (EICR) describing S\_CLK frequency programming.

 S\_RST, S\_FRAME, and S\_INT shown in Figure 22 and Figure 23 depict timing relationships to sys\_logic\_clk and S\_CLK and do not describe functional relationships between S\_RST, S\_FRAME, and S\_INT. See the PC107A User's Manual for a complete description of the functional relationships between these signals.

 The sys\_logic\_clk waveform is the clocking signal of the internal peripheral logic from the output of the peripheral logic PLL; sys\_logic\_clk is the same as SDRAM\_SYNC\_IN when the SDRAM\_SYNC\_OUT to SDRAM\_SYNC\_IN feedback loop is implemented and the DLL is locked. See the PC107A User's Manual for a complete clocking description.

Figure 22. EPIC Serial Interrupt Mode Output Timing Diagram

# IEEE 1149.1 (JTAG) AC Timing Specifications

Table 18 provides the JTAG AC timing specifications for the PC107A while in the JTAG operating mode.

At recommended operating conditions (see Table 3 on page 12) with  $LV_{DD}$  = 3.3 ±0.3V

Num	Characteristics <sup>(4)</sup>	Min	Max	Unit	Notes
	TCK Frequency of Operation	0	25	MHz	
1	TCK Cycle Time	40	_	ns	
2	TCK Clock Pulse Width Measured at 1.5V	20	_	ns	
3	TCK Rise and Fall Times	0	3	ns

### Clock Relationships Choice

The PC107A's internal PLL is configured by the PLL\_CFG[0–3] signals. For a given PCI\_SYNC\_IN (PCI bus) frequency, the PLL configuration signals set the Core/Memory/Processor PLL (VCO) frequency of operation for the PCI-to-Core/Memory/Processor frequency multiplying, if any. All valid PLL configurations for the PC107A are shown in Table 19.

Table 19.	PC107A	Microprocessor	PLL	Configuration
-----------	--------	----------------	-----	---------------

		66 MH	Iz Part	100 MHz Part

Notes: 1. PLL\_CFG[0-3] settings not listed (00000100, 0110, 0111, 1010, 1011, and 1110) are reserved.

In PLL Bypass mode, the PCI\_SYNC\_IN input signal clocks the internal core directly, the PLL is disabled, and the PCI: core mode is set for 1:1 mode operation. The AC timing specifications given in this document do not apply in PLL Bypass mode.
 In Clock Off mode, no clocking occurs inside the PC107A regardless of the PCI\_SYNC\_IN input.

In Clock Off mode, no clocking occurs inside the PC107A regardless of the
 Limited due to maximum memory VCO = 200 MHz.

5. Limited due to maximum memory VCO = 200

6. Range values are shown rounded down to the nearest whole number (decimal place accuracy removed) for clarity.

7. Limited by maximum memory bus speed.

# System Design Information

#### PLL Power Supply Filtering

The AV<sub>DD</sub> and LAV<sub>DD</sub> power signals are provided on the PC107A to provide power to the peripheral logic/memory bus PLL and the SDRAM clock delay-locked loop (DLL), respectively. To ensure stability of the internal clocks, the power supplied to the AV<sub>DD</sub> and LAV<sub>DD</sub> input signals should be filtered of any noise in the 500 kHz to 10 MHz resonant frequency range of the PLLs. A separate circuit similar to the one shown in Figure 30 using surface mount capacitors with minimum effective series inductance (ESL) is recommended for each of the AV<sub>DD</sub> and LAV<sub>DD</sub> power signal pins. Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over using multiple values.

The circuits should be placed as close as possible to the respective input signal pins to minimize noise coupled from nearby circuits. Routing directly as possible from the capacitors to the input signal pins with minimal inductance of vias is important but proportionately less critical for the LAV<sub>DD</sub> pin.

## Power Supply Voltage Sequencing

The notes in Table 3 on page 12 contain cautions illustrated in Figure 3 on page 13 about the sequencing of the external bus voltages and internal voltages of the PC107A. These cautions are necessary for the long term reliability of the part. If they are violated, the electrostatic discharge (ESD) protection diodes will be forward biased and excessive current can flow through these diodes. Figure 3 shows a typical ramping voltage sequence where the DC power sources (voltage regulators and/or power supplies) are connected as shown in Figure 31. The voltage regulator delay shown in Figure 3 can be zero if the various DC voltage levels are all applied to the target board at the same time. The ramping voltage sequence shows a scenario in which the V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> power plane is not loaded as much as the OV<sub>DD</sub>/GV<sub>DD</sub> power plane and thus V<sub>DD</sub>/AV<sub>DD</sub>/LAV<sub>DD</sub> ramps at a faster rate than OV<sub>DD</sub>/GV<sub>DD</sub>.

If the system power supply design does not control the voltage sequencing, the circuit of Figure 31 can be added to meet these requirements. The MUR420 diodes of Figure 31 control the maximum potential difference between the 3.3 bus and internal voltages on power-up and the 1N5820 Schottky diodes regulate the maximum potential difference on power-down.

#### Decoupling Recommendations

Due to the PC107A's dynamic power management feature, large address and data buses, and high operating frequencies, the PC107A can generate transient power surges and high frequency noise in its power supply, especially while driving large capacitive loads. This noise must be prevented from reaching other components in the PC107A system, and the PC107A itself requires a clean, tightly regulated source of power. Therefore, it is recommended that the system designer place at least one decoupling capacitor at each  $V_{DD}$ ,  $OV_{DD}$ ,  $GV_{DD}$ , and  $LV_{DD}$  pin of the PC107A. It is also recommended that these decoupling capacitors receive their power from separate  $V_{DD}$ ,  $OV_{DD}$ ,  $GV_{DD}$ ,  $GV_{DD}$ , and GND power planes in the PCB, utilizing short traces to minimize inductance. These capacitors should have a value of 0.1  $\mu$ F. Only ceramic SMT (surface mount technology) capacitors should be used to minimize lead inductance, preferably 0508 or 0603, oriented such that connections are made along the length of the part.

In addition, it is recommended that there be several bulk storage capacitors distributed around the PCB, feeding the V<sub>DD</sub>, OV<sub>DD</sub>, GV<sub>DD</sub>, BV<sub>DD</sub>, and LV<sub>DD</sub> planes, to enable quick recharging of the smaller chip capacitors. These bulk capacitors should have a low ESR (equivalent series resistance) rating to ensure the quick response time necessary. They should also be connected to the power and ground planes through two vias to minimize inductance. Suggested bulk capacitors-100 – 330  $\mu$ F (AVX TPS tantalum or Sanyo OSCON).

#### Connection Recommendations

To ensure reliable operation, it is highly recommended to connect unused inputs to an appropriate signal level. Unused active low inputs should be tied to  $OV_{DD}$ . Unused active high inputs should be connected to GND. All NC (no-connect) signals must remain unconnected.

Power and ground connections must be made to all external V<sub>DD</sub>, OV<sub>DD</sub>, GV<sub>DD</sub>, LV<sub>DD</sub>, BV<sub>DD</sub>, and GND pins of the PC107A.

The PCI\_SYNC\_OUT signal is intended to be routed halfway out to the PCI devices and then returned to the PCI\_SYNC\_IN input of the PC107A.

The SDRAM\_SYNC\_OUT signal is intended to be routed halfway out to the SDRAM devices and then returned to the SDRAM\_SYNC\_IN input of the PC107A. The trace length may be used to skew or adjust the timing window as needed. See Motorola application note "AN1794/D" for more information on this topic.

The TRST signal must be asserted during reset to ensure proper initialization and operation of the PC107A. It is recommended that the TRST signal be connected to the system HRESET signal or pulled down with a  $100\Omega - 1 \ k\Omega$  resistor.

#### Pull-up/Pull-down Resistor Requirements

The data bus input receivers are normally turned off when no read operation is in progress; therefore, they do not require pull-up resistors on the bus. The processor data bus signals are: DH[0–31], DL[0–31], and PAR[0–7]. The memory data bus signals are: MDH[0–31], MDL[0–31], and PAR/AR[0–7].

If the 32-bit data bus mode is selected, the input receivers of the unused data and parity bits (DL[0–31], DP[4–7], MDL[0–31], and PAR[4–7]) will be disabled, and their outputs will drive logic zeros when they would otherwise normally be driven. For this mode, these pins do not require pull-up resistors, and should be left unconnected by the system to minimize possible output switching.

It is recommended that  $\overline{\text{ARTRY}}$ ,  $\overline{\text{TA}}$ , and  $\overline{\text{TS}}$  have weak pull-up resistors (2 k $\Omega$  – 10 k $\Omega$ ) connected to  $\text{BV}_{\text{DD}}$ .

It is recommended that MTP[1–2] and TEST2 have weak pull-up resistor (2 k $\Omega$  – 10 k $\Omega$ ) connected to GV<sub>DD</sub>.

It is recommended that the following signals be pulled up to  $OV_{DD}$  with weak pull-up resistors (2 k $\Omega$  – 10 k $\Omega$ ): SDA, SCL, TEST1, and FTP[3–3].

It is recommended that the following PCI control signals be pulled up to  $LV_{DD}$  with weak pull-up resistors (2 k $\Omega$  – 10 k $\Omega$ ): DEVSEL, FRAME, IRDY, LOCK, PERR, SERR, STOP, TRDY and INTA. The resistor values may need to be adjusted stronger to reduce induced noise on specific board designs.

The following pins have internal pull-up resistors enabled at all times: REQ[06–4], TCK, TDI, TMS, and TRST, BR1, HRESET\_CPU, MCP, QACK, SRESET, TEST and TRIG\_OUT. See Table 1, "PC107A Pinout Listing," on page 5 for more information.

The following pins have internal pull-up resistors enabled only while device is in the reset state: MDL0, FOE, RCS0, SDRAS, SDCAS, CKE, SDBAO, and SDMA[10–1]. See Table 1, "PC107A Pinout Listing," on page 5 for more information.

The following pins are reset configuration pins: MDL0, FOE, RCS0, SDBAO, SDMA[10–1], and PLL\_CFG[0–3]. These pins are sampled during reset to configure the device.

Any other unused active low input pins should be tied to a logic one level via weak pullup resistors ( $2 k\Omega - 10 k\Omega$ ) to the appropriate power supply listed in Table 3 on page 12. Unused active high input pins should be tied to GND via weak pull-down resistors ( $2 k\Omega - 10 k\Omega$ ).

## Definitions

#### Datasheet Status Description

#### Table 20. Datasheet Status

Datasheet Status		Validity	
Objective specification	This datasheet contains target and goal specifications for discussion with customer and application validation.	Before design phase	
Target specification	This datasheet contains target or goal specifications for product development.	Valid during the design phase	
Preliminary specification $\alpha$ -site	This datasheet contains preliminary data. Additional data may be published later; could include simulation results.	Valid before characterization phase	
Preliminary specification $\beta$ -site	This datasheet contains also characterization results.	Valid before the industrialization phase	
Product specification	This datasheet contains final product specification.	Valid for production purposes	
Limiting Values			

Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

#### **Application Information**

Where application information is given, it is advisory and does not form part of the specification.

#### Life Support Applications

These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Atmel customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Atmel for any damages resulting from such improper use or sale.

#### Differences with Commercial Part

#### **Atmel Corporation**

2325 Orchard Parkway San Jose, CA 95131, USA Tel: 1(408) 441-0311 Fax: 1(408) 487-2600

#### **Regional Headquarters**

#### Europe

Atmel Sarl Route des Arsenaux 41 Case Postale 80 CH-1705 Fribourg Switzerland Tel: (41) 26-426-5555 Fax: (41) 26-426-5500

#### Asia

Room 1219 Chinachem Golden Plaza 77 Mody Road Tsimshatsui East Kowloon Hong Kong Tel: (852) 2721-9778 Fax: (852) 2722-1369

#### Japan

9F, Tonetsu Shinkawa Bldg. 1-24-8 Shinkawa Chuo-ku, Tokyo 104-0033 Japan Tel: (81) 3-3523-3551 Fax: (81) 3-3523-7581

#### **Atmel Operations**

Memory

2325 Orchard Parkway San Jose, CA 95131, USA Tel: 1(408) 441-0311 Fax: 1(408) 436-4314

#### Microcontrollers

2325 Orchard Parkway San Jose, CA 95131, USA Tel: 1(408) 441-0311 Fax: 1(408) 436-4314

La Chantrerie BP 70602 44306 Nantes Cedex 3, France Tel: (33) 2-40-18-18-18 Fax: (33) 2-40-18-19-60

#### ASIC/ASSP/Smart Cards

Zone Industrielle 13106 Rousset Cedex, France Tel: (33) 4-42-53-60-00 Fax: (33) 4-42-53-60-01

1150 East Cheyenne Mtn. Blvd. Colorado Springs, CO 80906, USA Tel: 1(719) 576-3300 Fax: 1(719) 540-1759

Scottish Enterprise Technology Park Maxwell Building East Kilbride G75 0QR, Scotland Tel: (44) 1355-803-000 Fax: (44) 1355-242-743

#### **RF**/Automotive

Theresienstrasse 2 Postfach 3535 74025 Heilbronn, Germany Tel: (49) 71-31-67-0 Fax: (49) 71-31-67-2340

1150 East Cheyenne Mtn. Blvd. Colorado Springs, CO 80906, USA Tel: 1(719) 576-3300 Fax: 1(719) 540-1759

#### Biometrics/Imaging/Hi-Rel MPU/

High Speed Converters/RF Datacom Avenue de Rochepleine BP 123 38521 Saint-Egreve Cedex, France Tel: (33) 4-76-58-30-00 Fax: (33) 4-76-58-34-80
