

# PIN photodiode amplifier C4890

## Wide bandwidth amplifier (1.5 GHz, 20 dB)

C4890 wide-band amplifier, when connected to a high-speed PIN photodiode (S5791, S5972, S5973, etc.) converts optical signals at a maximum of 1.5 GHz into voltage outputs with exceptionally low distortion and 20 dB gain.

C4890 can also be combined with other types of PIN photodiodes and APDs (avalanche photodiodes) to serve as a high-frequency amplifier for optical measurements in a wide range of fields including industry and research applications.

### Features

- Wide bandwidth, high gain, flat gain spectrum
- Flat, low group delay characteristics and low noise
- Input/output impedance: 50  $\Omega$
- Small size, light weight, low price
- Single power supply operation (+12 V)

### Applications

- High frequency amplifier for measurement
- PIN photodiode evaluation

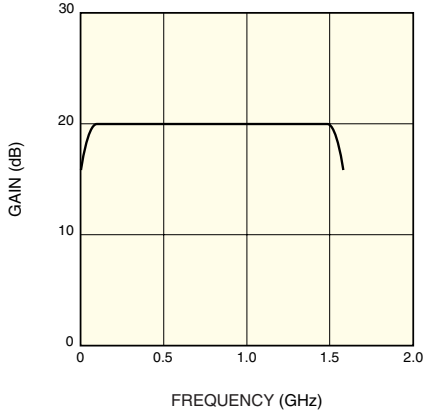

### ■ Absolute maximum ratings

Parameter	Condition	Value	Unit
Supply voltage		+13.5	V
Input voltage	Continuation RF input	+15	dBm
	DC	+1.25	V
Operating temperature		0 to +60	°C
Storage temperature		-10 to +70	°C

### ■ Electrical characteristics (Ta=25 °C, Vcc=12 V, Input/output is terminated with 50 $\Omega$ load.)

Parameter	Condition	Min.	Typ.	Max.	Unit
Cut-off frequency (-3 dB)	High band	1.0	1.5	-	GHz
	Low band	-	5	10	MHz
Gain	f=1.0 GHz	18	20	-	dB
Gain deviation within bandwidth	f=10 MHz to 1.0 GHz	-	$\pm 1.0$	-	dB
Group delay time		-	700	-	ps
VSWR	Input	-	1.1	-	dB
	Output	-	1.5	-	dB
1 dB compression point		-	7	-	dBm
Rise time		-	240	-	ps
Noise figure		-	8	-	dB
Current consumption		-	45	-	mA

■ Application example: High-speed O/E converter module

A high-sensitivity O/E converter can be easily configured by using C4890 in conjunction with a high-speed PIN photodiode (S5973, etc). The following is an example when C4890 is used with S5973 to amplify the output signal after receiving an attenuator. Major performance items are shown below.

Effective bandwidth: 5 MHz to 1.5 GHz

The lower limit is determined by the amplifier (C4890) and the upper limit by the photodiode.

$$\text{Conversion sensitivity (V/W)} = 0.5 \text{ A/W} \times 50 \times (100 - \alpha) / 100 \times 10 \text{ (}\lambda=850 \text{ nm)}$$

Detection limit: 4.4  $\mu$ Wrms ( $\lambda=850$  nm, BW=1.5 GHz)

Depends on the amplifier NF (NF=8 dB Typ.).

■ Connection example

Resistance value according to the attenuator damp quantity

Damp quantity (dB)	Damp rate (%)	R1, R2 ( $\Omega$ )	R3 ( $\Omega$ )
0	0	0	50
3	30	8.2	150
6	50	16	68
10	70	27	36
